

Activity 8 Assessment

Subtracting Integers

Subtracting Integers

Writes an expression to describe a given model of integer subtraction

What difference could this model represent?

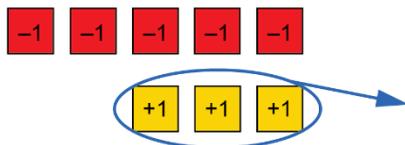

“The model represents $(-2) - (+4)$ because you would need to add 4 zero pairs to -2 to be able to subtract 4.

Subtracts a positive integer with or without a model

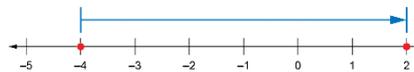

$$(-2) - (+3)$$

“I can use tiles to subtract 3 from -2 . I start with 2 red tiles to represent -2 . I want to take away 3 yellow tiles but don't have any. So, I add 3 zero pairs and then remove the yellow tiles. I am left with 5 red tiles, so the answer is -5 .”

Subtracts a negative integer with or without a model

“I know that one meaning of difference is the distance between 2 numbers, starting from the number being subtracted. I can use a number line to determine $2 - (-4)$. The difference is $+6$.”

Uses integers to model and solve applied problems

One winter evening it was -5°C . Overnight, the temperature decreased by 7°C . Write a subtraction sentence, then calculate the difference to determine the temperature the next morning.

“The starting temperature was -5°C . Since the temperature decreased by 7°C , I can represent the situation as $(-5) - 7$, which is the same as $-5 + (-7)$, or -12 . The temperature the next morning was -12°C .”

Observations/Documentation
